

## Digital Printing for the World of Blisters

In the world of blister production, digital printing is playing an increasing role in cost-effective and flexible production.

Hapa's line of dedicated UV drop-on-demand digital printers is designed to print variable data and cater to the smallest production volumes cost-effectively. It increases production agility, further cutting costs.

The Hapa Hybrid is a system combining conventional UV Flexo print technology with UV digital printing. Unchanged text and graphics can be flexo printed and all variable print digitally printed, optimizing flexibility and per-pack savings.

BlisterJet, an off line printer for semi-finished blister packs is available for single or CMYK printing. This system can be installed at points of distribution or market destination to finish blister shipment.

All Hapa printing systems are designed to work with preprinted or blank stock.
